

**Experience the Convenience of the Daytona
Optomap Retinal Exam**

The Optos Daytona provides an unequaled 200 degree view of your retina in a high-resolution, high-contrast digital image- the Optomap. This comprehensive view of up to 82% of the retina (in one image) gives our doctor the opportunity to identify and follow peripheral retinal pathology much more easily. **In many cases, we can now avoid the strong dilating drops during the exam.** The dilation process will make reading things up close difficult and make lights seem brighter than usual. This will last for 3-5 hours, although it may last longer for some people.

To provide the highest level of care, our doctor strongly recommends that all of our patients have this procedure performed annually. It is especially important for people who have any or more of the following:

1. Headaches
2. Floaters, spots or flashes of light in vision
3. Family (or personal) history of **hypertension or high cholesterol**
4. Family (or personal) history of **diabetes**
5. Family (or personal) history of **glaucoma**
6. Family (or personal) history of **macular degeneration or retinal disorders**
7. Recent changes in vision
8. Vision not correctable to 20/20
9. Never had the procedure previously
10. Nearsightedness

The **optomap**® Retinal Exam is fast, easy, and comfortable. The results will be reviewed with you during your exam by the doctor.

In declining Optomap, I am assuming all risks associated with failure to diagnose eye conditions due to lack of information which may have been provided by this test.

Please check the appropriate line and sign at the bottom

I DO want Optomap retinal imaging, I understand that a **\$40 copay** applies.

I DO NOT want Optomap retinal imaging and prefer to be dilated.
